The memory cell is the fundamental building block of computer memory. The memory cell is an electronic circuit that stores one bit of binary information and it must be set to store a logic 1 (high voltage level) and reset to store a logic 0 (low voltage level). Its value is maintained/stored until it is changed by the set/reset process.

Random-access memory - Wikipedia

Memory ordering describes the order of accesses to computer memory by a CPU. The term can refer either to the memory ordering generated by the compiler during compile time, or to the memory ordering generated by a CPU during runtime. In modern microprocessors, memory ordering characterizes the CPU's ability to reorder memory operations - it is a type of out-of-order execution.

The First Time Designer's Guide is a basic overview of Intel embedded development process and tools for the first time user. The chapter provides information about the design flow and development tools, interactions, and describes the differences between the Nios II processor flow and a typical discrete microcontroller design flow.
